W. I. B. S. STUDIO,
ROSEAU,
DOMINICA.

6th October, 1964.

Mr. Ron B. Schiller,
National Radio Club,
Monmouth Beach,
New Jersey.

Dear Sir,

Thank you for your letter of 21st September.

It was indeed interesting to read your report of WIBS Roseau reception on Monday the 14th September. Being an amateur radio enthusiast, I was pleased to learn that such a low-power transmitter, which was primarily designed for island-wide coverage, was heard so far. Your data seems to correspond with the programme which was scheduled for that evening.

I think some technical details of the transmitter will be of interest to you. WIBS Roseau is a sub-station which presently radiates 250 watts. The antenna, a $\frac{1}{4}$ wave Marconi, is a 140 ft. mast which is grounded by ninety 350 ft. radials laid at intervals of 4°.

By the way, I will keep the details of your transmitter for reference when our club starts transmitting.

Hoping to hear from you again.

Yours faithfully,

P. R. Polydore
